## 4 X 41W QUAD BRIDGE CAR RADIO AMPLIFIER

## 1 FEATURES

- HIGH OUTPUT POWER CAPABILITY:
- $4 \times 41 \mathrm{~W} / 4 \Omega \mathrm{MAX}$.
- $4 \times 25 \mathrm{~W} / 4 \Omega$ @ $14.4 \mathrm{~V}, 1 \mathrm{KHz}, 10 \%$
- LOW DISTORTION
- LOW OUTPUT NOISE
- ST-BY FUNCTION
- MUTE FUNCTION
- AUTOMUTE AT MIN. SUPPLY VOLTAGE DETECTION
- LOW EXTERNAL COMPONENT COUNT:
- INTERNALLY FIXED GAIN (26dB)
- NO EXTERNAL COMPENSATION
- NO BOOTSTRAP CAPACITORS

## 2 PROTECTIONS:

- OUTPUT SHORT CIRCUIT TO GND, TO Vs, ACROSS THE LOAD
- VERY INDUCTIVE LOADS
- OVERRATING CHIP TEMPERATURE WITH SOFT THERMAL LIMITER
- LOAD DUMP VOLTAGE
- FORTUITOUS OPEN GND

- ESD

## 3 DESCRIPTION

The TDA7388 is a new technology class AB Audio Power Amplifier in Flexiwatt 25 package designed for high end car radio applications.
Thanks to the fully complementary PNP/NPN output configuration the TDA7388 allows a rail to rail output voltage swing with no need of bootstrap capacitors. The extremely reduced components count allows very compact sets.

## 5 APPLICATION HINTS

(ref. to the circuit of fig. 4)

### 5.1 SVR

Besides its contribution to the ripple rejection, the SVR capacitor governs the turn ON/OFF time sequence and, consequently, plays an essential role in the pop optimization during ON/OFF transients. To conveniently serve both needs, ITS MINIMUM RECOMMENDED VALUE IS $\mathbf{1 0} \mu \mathrm{F}$.

### 5.2 INPUT STAGE

The TDA7388'S inputs are ground-compatible and can stand very high input signals ( $\pm 8 \mathrm{Vpk}$ ) without any performances degradation. If the standard value for the input capacitors $(0.1 \mu \mathrm{~F})$ is adopted, the low frequency cut-off will amount to 16 Hz .

### 5.3 STAND-BY AND MUTING

STAND-BY and MUTING facilities are both CMOS-COMPATIBLE. If unused, a straight connection to Vs of their respective pins would be admissible.
Conventional/low-power transistors can be employed to drive muting and stand-by pins in absence of true CMOS ports or microprocessors. R-C cells have always to be used in order to smooth down the transitions for preventing any audible transient noises.
Since a DC current of about $10 \mu \mathrm{~A}$ normally flows out of pin 22 , the maximum allowable muting-series resistance (R2) is $70 \mathrm{~K} \Omega$, which is sufficiently high to permit a muting capacitor reasonably small (about $1 \mu \mathrm{~F}$ ).
If $\mathrm{R}_{2}$ is higher than recommended, the involved risk will be that the voltage at pin 22 may rise to above the 1.5 V threshold voltage and the device will consequently fail to turn OFF when the mute line is brought down. About the stand-by, the time constant to be assigned in order to obtain a virtually pop-free transition has to be slower than $2.5 \mathrm{~V} / \mathrm{ms}$.
