

TDA7377

LINEAR INTEGRATED CIRCUIT

2 x 30W DUAL/QUAD POWER AMPLIFIER FOR CAR RADIO

DESCRIPTION

The UTC **TDA7377** is a class AB car radio amplifier for car radio, it can work either in dual bridge or quad single ended configuration. The exclusive fully complementary structure of the output stage and the internally fixed gain guarantees the highest possible power performances with few external components. The on-board clip detector simplifies gain compression operation. The fault diagnostics makes it possible to detect mistakes during car radio set assembly and wiring in the car.

FEATURES

- * High Output Power@Vcc=14.4V, f=1kHz, RL=4Ω:
 - 2 x 35W Max.
 - 2 x 20W@THD= 10%
 - 4 x 6 W @10%
 - 4 x 10W / 2Ω@10%
 - 2 x 30W / EIAJ@Vcc=13.7V, RL=4Ω
- * CMOS Compatible Stand-by Function (Low Icc)
- * No Audible pop During st-by Operations
- * Internally Fixed Gain (26dB BTL and 20dB single ended)
- * No Bootstrap Capacitors and boucherot Cells
- * Diagnostics Facility on pin10 when output Clipping, shorted to Vcc or GND, thermal shutdown and soft short at turn on.
- * Rail to rail output swing
- * Absolute Stability Without Any External Compensation.

PROTECTIONS

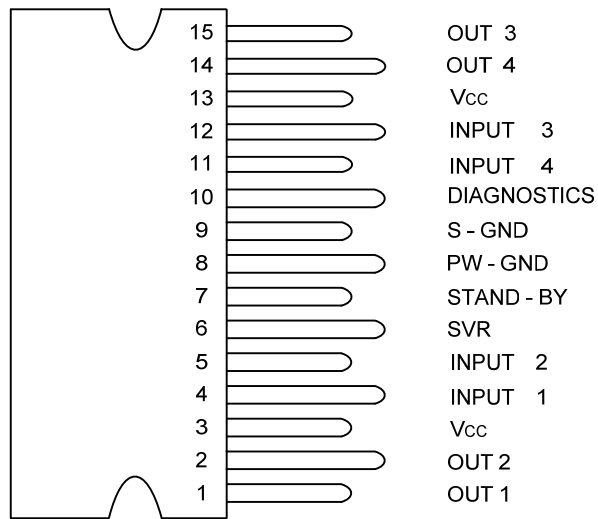

- * Load Dump Voltages surge
- * Reversed Battery
- * Output DC Short Circuit protection with Low current when shorted to GND or Vcc.
- * Output AC short circuit protection: across the load
- * Silent Turn On/Off
- * thermal shutdown
- * Load very Inductive speakers
- * Fortuitous Open GND
- * ESD

■ TYPICAL APPLICATION INFORMATION

Diagnostics Facility note:

UTC **TDA7377** built in a diagnostic circuitry, when following events appearing: clipping in the output signal, thermal shutdown, and output fault including short to GND, short to V_S and soft short at turn on.

When the event is detected, The information is available across an open collector output (pin 10) through a current sinking (see Fig 4).The current sinking at pin 10 is triggered when a certain distortion level is reached at any of the outputs. This function allows gain compression possibility whenever the amplifier is overdriven. The current sinking at pin 10 also can be triggered When the IC's operating temperature raise to about 10°C before the shutdown threshold.

Normally the clip detector signaling produces a low level at pin 10 that is shorter than that present under faulty conditions; This can be used to discriminate each event (clipping detection, output fault, thermal proximity).
